Exocrine Pancreatic Cancer

Exocrine Pancreatic Cancer

For a long time, approximately since Oberlin and Guerin described the multifocal origin of pancreatic cancers and precancerous pancreatic lesions, no important study dealing with the entire subject of pancreatic cancer has been published in France and probably in the international literature. For some decades the knowledge acquired 40 years or more ago was not improved appreciably, though the frequency of the disease started to increase in occidental countries. This has recently changed, and the progress of the medical sciences has spread to the pancreas. Although the surgical or medical prognosis of the most frequent form of pancreatic cancer, exocrine adenocarcinoma, remains very bad, recent studies have shown the multiplicity of its pathological forms, some being less severe so that curative surgery is possible. New experimental models, particularly in the hamster, and the use of carcinogenic drugs allow experimental studies on lesions similar to those in man. Oncologic immunology is still at its beginnings but shows promise for diagnosis and treatment. Though modern techniques of imaging - sonography, aspirative cytology, CT scan, endoscopic catheterism, arteriography, and maybe in the future nuclear magnetic resonance - have not yet significantly influenced prognosis, they have made the diagnosis easier and more precocious. Yet in a disease that diffuses so rapidly to deep lymph nodes, it has not been proved whether early diagnosis can improve prognosis.
